# **Summary of Technical Specifications**

This document presents a non-exhaustive summary of some materials that Clarksville Foundry commonly produces. We can cross-reference the listed ASTM specifications to other specifying bodies such as DIN, JIS, SAE, etc. upon request. Clarksville Foundry also specializes in producing materials to custom and/or proprietary specifications. All summaries of different types of iron presented are general rules of thumb, but not universally true. Physical properties can be altered dramatically by various heat treatments and/or the addition of selected alloying elements. For more information, contact us today.

## **Gray Iron Specifications**

|                                | Grade   | Grade   | Grade  | Grade  | Grade  |
|--------------------------------|---|---|--|--|--|
|                                | G2000   | G2500   | G3000  | G3500  | G4000  |
| Tensile Strength Minimum (PSI) | 20,000  | 25,000  | 30,000   | 35,000   | 40,000   |
| Brinell Hardness Range         | 187 Max   | 170-229   | 187-241  | 207-255  | 217-269  |
| Micro-Structure                | Large randomly<br>oriented carbon<br>flakes in<br>ferritic matrix | Large randomly<br>oriented carbon<br>flakes in<br>ferritic matrix | Medium length<br>randomly oriented<br>carbon flakes in<br>ferritic/pearlitic<br>matrix | Short to<br>medium length<br>randomly oriented<br>carbon flakes in<br>mostly pearlitic<br>matrix | Short to medium length carbon flakes in pearlitic matrix. Some carbides in thin sections |
| ASTM Specifications            | A48, A126,<br>A159  | A48, A159,<br>A319  | A48, A126,<br>A159, A319   | A48, A159,<br>A319   | A48, A126,<br>A159, A278   |

Gray irons tend to be brittle, and depending on the grade can offer superior vibration-dampening properties, easy machinibility and resistance to thermal shock. Many grades of gray iron respond readily to heat treatment to produce a wide range of physical properties. Some typical applications of various grades of gray iron include: municipal castings, high-temperature pressure-containing vessels, machine parts, gear cases, pumps, valves and pistons.

### **Ductile Iron Specifications**

|                                | Grade       | Grade           | Grade            | Grade        | Grade        |
|--------------------------------|-------------|-----------------|------------------|--------------|--------------|
|                                | 60-40-18    | 65-45-12        | 80-55-06         | 100-70-03    | 120-90-02    |
| Tensile Strength Minimum (PSI) | 60,000      | 65,000          | 80,000           | 100,000      | 120,000      |
| Yield Strength Minimum (PSI)   | 40,000      | 45,000          | 55,000           | 70,000       | 90,000       |
| Elongation in 2", Minimum (%)  | 18          | 12              | 6                | 3            | 2            |
| Brinell Hardness Range         | 143-187     | 156-217         | 187-255          | 241-302      | As specified |
|                                | Graphite    | Graphite        | Graphite         | Graphite     |              |
| Micro-Structure                | spheroids   | spheroids       | spheroids        | spheroids    | Tempered     |
| Wicro-Structure                | in ferritic | in mostly       | in mostly        | in pearlitic | martensite   |
|                                | matrix      | ferritic matrix | pearlitic matrix | matrix       |              |
| ASTM Specifications            | A395, A536  | A536            | A536             | A536         | A536         |

Ductile irons, depending on the grade, can offer the following properties: easy machinibility, resistance to catastrophic impact failure and crack propagation, good lubricity, wear resistance and substantial elongation. Some typical applications of various grades of ductile iron include: machine parts, gear and pump cases, impellers and transmission components.

# Austenitic Gray and Ductile Iron (Ni-Resist) Specifications

|                                | Grade   | Grade   | Grade   | Grade   | Grade   |
|--------------------------------|---|---|---|---|---|
|                                | N4361   | N4362b  | N4392D  | N4393D  | N4395D  |
| Tensile Strength Minimum (PSI) | 25,000  | 30,000  | 58,000  | 55,000  | 58,000  |
| Yield Strength Minimum (PSI)   | N/A   | N/A   | 30,000  | 30,000  | 30,000  |
| Elongation in 2", Minimum (%)  | N/A   | N/A   | 8   | 6   | 8   |
| Brinell Hardness Range         | 131-212   | 171-248   | 139-202   | 139-202   | 139-202   |
| Micro-Structure                | Uniformly distributed graphite flakes with some carbides in austenitic matrix | Uniformly distributed graphite flakes with some carbides in austenitic matrix | Uniformly distributed graphite spheroids in austenitic matrix | Uniformly distributed graphite spheroids in austenitic matrix | Uniformly distributed graphite spheroids in austenitic matrix |
| ASTM Specifications            | A436<br>Type 1  | A436<br>Type 2b   | A439<br>Type D-2  | A439<br>Type D-3  | A439<br>Type D-5  |

Depending on the grade, Ni-Resist irons can be resistant to corrosion, heat or wear. Some grades are readily machinable, and all are non-magnetic. Some common applications of various grades of Ni-Resist irons are valves, pump cases and impellers for corrosive applications.

#### White Iron Specifications

|                                | Grade<br>W5321 | Grade<br>W5321b | Grade<br>W5321d | Grade<br>W5322b | Grade<br>W5322d | Grade<br>W5323 |
|--------------------------------|----------------|-----------------|-----------------|-----------------|-----------------|----------------|
| Brinell Hardness (approximate) | 600            | 600             | 550             | 450             | 450             | 450            |
|                                | "White" iron,  | "White" iron,   | "White" iron,   | "White" iron,   | "White" iron,   | "White" iron,  |
| Micro-Structure                | essentially    | essentially     | essentially     | essentially     | essentially     | essentially    |
|                                | carbidic       | carbidic        | carbidic        | carbidic        | carbidic        | carbidic       |
|                                | A532           | A532            | A532            | A532            | A532            | A532           |
| ASTM Specifications            | Class I        | Class I         | Class I         | Class II        | Class II        | Class III      |
|                                | Type A         | Type B          | Type D          | Type B          | Type D          | Type A         |
|                                | (Ni-Cr-Hc)     | (Ni-Cr-Lc)      | (Ni-HiCr)       | (15% Cr-Mo)     | (20%  Cr-Mo)    | $(25\% \ Cr)$  |

White iron, also known as "hard iron" or "Ni-Hard," is an abrasion-resistant iron. White irons are typically specified by their hardness, and as such, tensile strength is not usually a limiting factor in their industrial use. White irons are virtually non-machinable, brittle on impact, and do not tolerate rapid thermal cycling well. They are commonly used in high-wear applications, such as: crusher parts, wear plates, mining machinery, milling machinery and earth-handling equipment.

# Austempered Ductile Iron (ADI) Specifications

We can produce the base material for any grade of ADI under ASTM specification A897. While we do not do any austempering in-house, we work closely with a number of heat treating facilities to ensure that the requested end-product reaches the customer. The physical properties of ADI are determined both by the chemistry of the base material and by carefully controlled variations of the two-part austempering heat treatment required to produce ADI. Those properties include high strength, wear resistance, work-hardenability, and depending on the grade specified, substantial elongation. ADI can offer many of the advantages of steel castings or fabrications, such as high tensile and yield strength, while still maintaining the high elongation and ease of castability characteristic of ductile iron. ADI can also offer superior wear-resistance as compared to other materials of equivalent hardness.
